

CLAIMS

[1](Amended) A steam cooker comprising:

a cooking chamber in which foods are put;

an external circulation path for blowing gas sucked from the cooking chamber via a suction port into the cooking chamber via a blowhole so that the gas strikes the foods in the cooking chamber;

a blower for generating gas current traveling from the suction port to the blowhole in the external circulation path; and

a steam generator for supplying steam to the gas passing through the external circulation path, wherein

the external circulation path is provided with a steam ejector in a position downstream of the blower for sucking steam generated by the steam generator.
